

MEI launches retail banknote recycler for self-checkout systems

- 09 May 2008

WEST CHESTER, Pa. — MEI, a developer of unattended payment systems, launched its Cashflow Banknote Recycler for self-checkout operations in all retail applications.

The Cashflow BNR is a point-of-sale cash-recycling device that combines the functions of a traditional bill acceptor and dispenser into one device, significantly reducing the cash float required for uninterrupted self-checkout operation.

The MEI Cashflow BNR has a compact footprint, operates at a high speed and has been designed for reliability. With the ability to recycle up to four denominations, the BNR allows self-service systems to run on less cash for longer periods of time. The modular design enables closed-loop cash management, and cash handling improves with its cash loader module that enables the device to serve customers immediately.

Several self-service equipment OEMs are currently preparing for field tests of new terminals using the Cashflow BNR.
